Objectives of Expert Lecture

The main objective of the course is to provide students with the basic concepts of Python, its syntax, functions and packages to enable them to write scripts for data manipulation and analysis. The course develops skills of writing and running a code using Python. The course covers various variables types and their features, basic operators and statements, loops, as well as the main packages for data science: NumPy, Pandas, Matplotlib. At the end of the course, students should be able to write short scripts to import, prepare and analyze data.

Introduction:

The Add-on course provides students with wide general overview of Python – a general-purpose programming language that is becoming ever more popular for data science. The focus is on the application of Python specifically for data science. The course is about ways to import, store and manipulate data, and helpful data science tools to conducting data analyses. The course is intended for students with little programming background. This Add-on course contain a comprehensive topic combining not only theory but also practical session. This Add-on Course is foundation for students who want to become a Data Scientist or Data Analytics.
